
A \$28M dilution model with clean percentages and one outcome. Wrong the moment you open it.

The model assumes the round closes exactly as the term sheet says. Full size, same price, 100% probability.

**Most rounds don't close that way.
Size gets cut, price gets
renegotiated, some term sheets die
in diligence.**

**No close-probability weight means
it's not a model. It's a hope,
formatted to look like math.**

**Does it show 60% of size closing?
Does it show no close at all? If not,
it's fiction with a decimal point.**

**Built these on desks in Seoul, Tokyo,
and the Gulf. Without a close-
probability column, it's not analysis,
it's decoration.**
