
2023 and 2024: nearly every pitch deck made the same claim. Our model beats GPT-4. Every deck was underwriting the same thing.

**Model performance is a
leaderboard game. New
model, new leaderboard, old
check worth less.**

Bottleneck resolution, packaging, interconnect, wafer yield, moves on physics and supply chain time, not sprint time. Edges compound longer.

**Inference economics, not
training benchmarks, decide
who is still standing in two
years.**

**Cerebras, a personal angel position:
the thesis was never best model, it
was who removes the bottleneck.**

Infrastructure bottlenecks get disrupted slower than models. The real bottleneck hides in whatever nobody pitches yet.
